ABSTRACT

Nymphaea nouchali (Burm. f) belongs to the family Nymphaeaceae, which is a family of flowering plants. It is the national flower of Bangladesh and commonly known as “Shapla” in Bengali. N. nouchali is a large perennial aquatic herb with short round rhizomes. These flowers were recommended for traditional healers for treatments of renal diseases, piles and as cardio tonic and also had wide range of applications in ayruveda medicine. The present investigation was carried out to evaluate the safety of pet ether extract of Nymphaea nouchali (PNN) whole plant by determining its potential toxicity after acute and chronic administration in rats. Study on acute toxicity of extract found to be safe at the doses 2000mg/kg body weight orally as per OECD guidelines No.423. General behavior adverse effects and mortality were determined for up to 14 days. In the chronic toxicity study, the PNN was administered orally at doses of 100, 200 and 400 mg/kg once in a week for 6 weeks to rats. Biochemical and hematological parameters were determined after 6 weeks. In the acute study in rats, there was no toxicity/ death was observed at the dose of 2000mg/kg b.w. The onset of toxicity and signs of toxicity also not there. In the chronic toxicity study, no significant treatment-related changes in the levels of haematological, hepatic and renal parameters such as SGOT, SGPT, cholesterol, creatinine, urea, uric acid, protein and glucose, and serum ALP activities were observed at the termination of the study. It suggests that the pet ether extract of Nymphaea nouchali does not appear to have significant toxicity. In view of the dose of Nymphaea nouchali consumed in traditional medicine, there is a wide margin of safety for the therapeutic use of the pet ether extract of Nymphaea nouchali whole plant.

Key words: Alocassia macrorhiza (L.), Traditional Medicine, Acute and Chronic Toxicity, Hematological Parameters, Biochemical Parameters.

INTRODUCTION

Nymphaea nouchali (Burm. f) belongs to the family Nymphaeaceae, which is a family of flowering plants. It is the national flower of Bangladesh and commonly known as “Shapla” in Bengali. N. nouchali is a large perennial aquatic herb with short round rhizomes. These flowers were recommended for traditional healers for treatments of renal diseases, piles and as cardio tonic and also had wide range of applications in ayruveda medicine. The flowers of N. nouchali are used in Chyawanprash Special, DiabEaze, Pyleena Capsule [1]. And also whole plants are used for the treatment of ulcers and sores In spite of the use of Nymphaea nouchali in traditional medicine and its potential for toxicity, systematic evaluation of its toxic effects is lacking. Therefore, the aim of the present study was to investigate the acute and chronic toxic effects of petroleum ether extract of Nymphaea nouchali in rodents.
MATERIALS AND METHODS

Plant material

The whole plant of Nymphaea nouchali was collected from Tirumala hills, Tirupati, Andhra Pradesh, India. It was identified and authenticated by Prof. Madhava Chetty, K., Taxonomist, S.V. University, Tirupati, Andhra Pradesh, India. A voucher specimen has been kept in our laboratory for future reference.

Preparation of plant extract

The collected whole plant was dried at room temperature, pulverized by a mechanical grinder, sieved through 40 mesh. About 100 g of powdered materials were extracted with petroleum ether (60-80°C) using soxhlet apparatus. The extraction was carried out until the extractive becomes colourless. The extracts is then concentrated and dried under reduced pressure. The solvent free semisolid mass thus obtained is dissolved in tween 80 and used for the experiment. The percentage yield of prepared extract was around 10.5% w/w.

Animals Used

Albino rats (180-200 g) of either sex were maintained in a 12 h light/dark cycle at a constant temperature 25°C with free access to feed (Sai durga feeds and foods, Bangalore) and water. All animals were fasted prior to all assays and were allocated to different experimental groups each of 6 rats. Moreover the animals were kept in specially constructed cages to prevent coprophagia during the experiment. All experiments were carried out according to the guidelines for care and use of experimental animals and approved by Committee for the purpose of Control and Supervision of Experiments on Animals (CPCSEA). Ethical committee clearance was obtained from IAEC (Institutional Animal Ethics Committee) of CPCSEA.

Acute toxicity study of Nymphaea nouchali extract in rats

The procedure was followed by using OECD 423 (Acute Toxic Class Method) [2]. The acute toxic class method is a step wise procedure with three animals of a single sex per step. Depending on the mortality or moribund status of the animals and the average two to three steps may be necessary to allow judgment on the acute toxicity of the test substance. This procedure results in the use number of animals while allowing for acceptable data based scientific conclusion. The method used to defined doses (2000, 1000, 500, 50, 5 mg/kg body weight, Up-and-Down Procedure). The starting dose level of PNN was 2000 mg/kg body weight p.o as most of the crude extracts posses LD 50 value more than 200 mg/kg p.o. Dose volume was administered 0.2 ml per 100 gm body weight to overnight fasted rats with were ad libitum. Food was withheld for a further 3-4 hours after administration of PNN and observed for signs for toxicity.

The body weight of the rats before and after administration were noted that changes in skin and fur, eyes, mucous membranes, respiratory, circulatory, autonomic and central nervous system and motor activity and behavior pattern were observed and also sign of tremors, convulsions, salivation, diarrhea, lethargy, sleep and coma were noted for 14 days. The onset of toxicity and signs of toxicity also noted. Hence, 1/20th (100 mg/kg), 1/10th (200 mg/kg) and 1/5th (400 mg/kg) of this dose were selected for further study.

Study of Chronic Toxicity of Nymphaea nouchali extract in rats

Design of Treatment

Animals were divided into 5 groups of six rats each.
Group I - Normal saline (0.9%, NaCl, 5 ml/kg, p.o) once in a week for 6 weeks.
Group II- Vehicle 1% SCMC (5 ml/kg, p.o) once in a week for 6 weeks.
Group III-V- Pet ether extract of Nymphaea nouchali whole plant at the dose of 100, 200 and 400 mg/kg, p.o respectively.

Animals from each group were sacrificed at the 6th week, after the last dose. Different haematological and serum biochemical tests were then performed.

Collection of blood and serum samples

Paired blood samples were collected by cervical decapitation from diethyl ether anaesthetized rats into heparinised bottles for haematological studies and clean non-heparinised bottles and allowed to clot. The serum was separated from the clot and centrifuged into clean bottles for biochemical analysis.

Methods for estimation of haematological parameters

Estimation of Hemoglobin [4], RBC count [4], WBC count [4], different leucocytic count [3], Elongation time [3] and ESR [5] were determined according to the standard procedures.

Determination of serum biochemical parameters

Blood Glucose, [6] Serum Bilirubin [7], Serum Glucocate – Oxaloacetate Transaminase (SGOT) [7], Serum Glutamate – Pyruvate Transaminase (SGPT) [7], Serum Alkaline Phosphatase (ALP) [7], Blood Cholesterol [6], Blood Urea [6], Serum Uric Acid [6], Blood Creatinine [6] and Serum protein[6] were estimated by standard procedures.

Statistical analysis

The data were expressed as mean ± standard error mean (S.E.M). The Significance of differences among the groups was assessed using one way and multiple way analysis of variance (ANOVA). The test followed by Dunnet’s test P values less than 0.05 were considered as significance.
RESULTS

Acute toxicity study

The body weight of the rats before and after administrations were noted that there is slightly increased the body weight. But there are no changes in skin and fur, eyes, mucous membranes, respiratory, circulatory, autonomic and central nervous system and motor activity and behavior pattern were observed and also no sign of tremors, convulsions, salivation, diarrhea, lethargy, sleep and coma were noted. The onset of toxicity and signs of toxicity also not there. In this study there was no toxicity/death were observed at the dose of 2000mg/kg b.w. The acute toxicity study in rats showed that at 2000 mg/kg dose, the plant is safe for consumption and for medicinal uses (Table 1).

Chronic toxicity study

The chronic oral administration of pet ether extract of Nymphaea nouchali whole plant caused no noticeable change in the general behaviour of the rats and, compared to the control group (saline and vehicle), no significant changes in body weight, food intake and utilization of food in the PNN treated rats. Both the control and treated rats appeared uniformly healthy at the end and throughout the six weeks period of study.

Effect of pet ether extract of Nymphaea nouchali whole plant on the haematological and biochemical parameters of rats

In the chronic toxicity study, the haematological parameters, hemoglobin concentration, clotting time, neutrophils, eosinophils, lymphocytes, monocytes, red and white blood cells in the treated rats did not differ significantly ($P > 0.01$) from that of the control group (Table 2) and all the values remained within normal limits throughout the experimental period. As shown in Table 3 & 4, no significant treatment-related changes in the levels of hepatic and renal parameters such as SGOT, SGPT, cholesterol, creatinine, urea, uric acid, protein and glucose, and serum ALP activities were observed at the termination of the study.

In this study, the pet ether extract of Nymphaea nouchali was found to be non-toxic in rats when administered orally in doses up to 2000 mg/kg, p.o. The onset of toxicity and signs of toxicity also not there. In this study there was no toxicity/death were observed at the dose of 2000mg/kg b.w. Based on this animal study, may be described as being practically non-toxic.

In the six weeks chronic toxicity study, the PNN at the doses of 100, 200 & 400mg/kg did not appear to affect the bodyweight or the behaviour of the rats and caused no significant changes in their food intake and utilization of food indicating normal metabolism in the animals and suggesting that, at the oral doses administered PNN did not retard the growth of rats. After six weeks treatment, there were also no treatment related changes in the haematological parameters (i.e. Glucose, creatinine, Bilirubin, SGOT, SGPT and ALP) were also unchanged by the doses of PNN 100, 200 & 400mg/kg. The lack of significant alterations in the levels of ALP, creatinine, Bilirubin, SGOT, SGPT and cholesterol, good indicators of liver and kidney functions.

### Discussion and conclusion

A Word Health Organization survey indicated that about 70–80% of the world’s populations rely on non-conventional medicine, mainly of herbal source, in their primary healthcare [8,9]. Although medicinal plants may produce several biological activities in humans, generally very little is known about their toxicity and the same applies for Alocassia macrorhiza (L.). Because safety should be the overriding criterion in the selection of medicinal plants for use in healthcare systems [10]. To determine the safety of drugs and plant products for human use, toxicological evaluation is carried out in various experimental animals to predict toxicity and to provide guidelines for selecting a ‘safe’ dose in humans [11]. One should, in addition to the use of historical documentation on Alocassia macrorhiza, also have formal toxicological evaluations of this plant to optimize its safe use as a medicine. The pet ether extract of Nymphaea nouchali used in the present study offers several advantages as a form of the Nymphaea nouchali medicine [12]. But before such evaluation can be fully justified in humans, the preclinical evaluation of the safety of the Nymphaea nouchali is required.

In this study, the pet ether extract of Nymphaea nouchali was found to be non-toxic in rats when administered orally in doses up to 2000 mg/kg, p.o. The onset of toxicity and signs of toxicity also not there. In this study there was no toxicity/death were observed at the dose of 2000mg/kg b.w. Based on this animal study, may be described as being practically non-toxic.
respectively [15]. The transaminases (SGOT and SGPT) are well known enzymes used as biomarkers predicting possible toxicity [16]. Generally, damage to the parenchymal liver cells will result in elevations of both these transaminases [17]. The transaminases were not significantly increased at the doses of PNN 100, 200 & 400mg/kg. It suggests that chronic ingestion of PNN did not alter the hepatocytes and kidneys of the rats, and, furthermore the normal metabolism of the animals. The relevance of this result may be associated with the biological value of the plant Alocassia macrorhiza (L.).

In conclusion, the present investigation demonstrates that at doses consumed in the traditional medicine, the pet ether extract of Nymphaea nouchali may be considered as relatively safe, as it did not cause either any lethality or changes of in the general behavior in both the acute and chronic toxicity studies in rats. Studies of this type are needed before a phytotherapeutic agent can be generally recommended for use.
